

Digital Literacy Awareness Quiz form

This quiz is designed to test basic digital literacy skills among students

What does "Digital Literacy" mean?

- ☒ Ability to use digital devices and internet effectively (Correct)
- ☐ Only knowing how to use social media
- ☐ Playing online games
- ☐ Watching videos online

Which of the following is a strong password?

- ☐ 123456
- ☐ password
- ☐ MyName123
- ☐ G7@M.9!pQ

Which of the following are safe online practices? (Select all that apply)

- ☐ Using strong passwords
- ☐ Sharing OTP with friends
- ☐ Avoiding suspicious links
- ☐ Updating software regularly

Write one way to protect your personal data online.

Long answer text

What should you do if you receive a suspicious email?

- ☐ Click the link immediately
- ☐ Ignore or report it (Correct)
- ☐ Reply with personal details
- ☐ Forward to everyone
- ☐ Add option or just "no"

Complete the function *solveMeFirst* to compute the sum of two integers.

Example

$a = 7$

$b = 3$

Return 10.

Function Description

Complete the *solveMeFirst* function with the following parameters:

- *int a*: the first value
- *int b*: the second value

Returns

- *int*: the sum of *a* and *b*

Constraints

$1 \leq a, b \leq 1000$

Sample Input

```
a = 2
b = 3
```

Sample Output

```
5
```

```
1  def solveMeFirst(a, b):  
2      return a + b  
3  
4  # Input  
5  a = int(input())  
6  b = int(input())  
7  
8  # Output  
9  print(solveMeFirst(a, b))
```

You have earned 1.00 point!
You are now 29 points away from the 1st star for your problem solving badge.

Congratulations

Given an array of integers, find the sum of its elements.

For example, if the array $ar = [1, 2, 3]$, $1 + 2 + 3 = 6$, so return 6.

Function Description

Complete the *simpleArraySum* function with the following parameter(s):

- $ar[n]$: an array of integers

Returns

- *int*: the sum of the array elements

Input Format

The first line contains an integer, n , denoting the size of the array.

The second line contains n space-separated integers representing the array's elements.

Constraints

$$0 < n, ar[i] \leq 1000$$

Sample Input

STDIN	Function
6	$ar[]$ size $n = 6$
1 2 3 4 10 11	$ar = [1, 2, 3, 4, 10, 11]$

Sample Output

31

Explanation

Print the sum of the array's elements: $1 + 2 + 3 + 4 + 10 + 11 = 31$.

Alice and Bob each created one problem for HackerRank. A reviewer rates the two challenges, awarding points on a scale from 1 to 100 for three categories: problem clarity, originality, and difficulty.

The rating for Alice's challenge is the triplet $a = (a[0], a[1], a[2])$, and the rating for Bob's challenge is the triplet $b = (b[0], b[1], b[2])$.

The task is to calculate their comparison points by comparing each category:

- If $a[i] > b[i]$, then Alice is awarded 1 point.
- If $a[i] < b[i]$, then Bob is awarded 1 point.
- If $a[i] = b[i]$, then neither person receives a point.

Example

$a = [1, 2, 3]$

$b = [3, 2, 1]$

- For elements $a[0]$, Bob is awarded a point because $a[0] < b[0]$.
- For the equal elements $a[1]$ and $b[1]$, no points are earned.
- Finally, for elements $a[2]$, $a[2] > b[2]$ so Alice receives a point.

The return array is $[1, 1]$ with Alice's score first and Bob's second.

Function Description

Complete the function `compareTriplets` with the following parameter(s):

- `int a[3]`: Alice's challenge rating
- `int b[3]`: Bob's challenge rating

Returns

- `int[2]`: the first element is Alice's score and the second is Bob's score

Input Format

The first line contains 3 space-separated integers, $a[0]$, $a[1]$, and $a[2]$, the respective values in triplet a .

The second line contains 3 space-separated integers, $b[0]$, $b[1]$, and $b[2]$, the respective values in triplet b .

Constraints

- $1 \leq a[i] \leq 100$
- $1 \leq b[i] \leq 100$

Sample Input 0

```
1  def compareTriplets(a, b):
2      alice = 0
3      bob = 0
4
5      for i in range(3):
6          if a[i] > b[i]:
7              alice += 1
8          elif a[i] < b[i]:
9              bob += 1
10
11     return [alice, bob]
12
13     # Input
14     a = list(map(int, input().split()))
15     b = list(map(int, input().split()))
16
17     # Output
18     result = compareTriplets(a, b)
19     print(result[0], result[1])
```

Built-in mutable sequence.

If no argument is given, the constructor creates a new empty list.

The argument must be an iterable if specified.

You have earned 10.00 points!

You are now 9 points away from the 1st star for your problem solving badge.
